UNIVERSITY OF CALOOCAN CITY / COMMUNITY EXTENSION SERVICES

INFORMATION SYSTEMS STRATEGIC PLAN (ISSP)

UCC-CES Partnership & Project Proposal Management System

Course: IS 111 ? IS Strategy, Management, and Acquisition
Institution: University of Caloocan City
Client Organization: UCC Community Extension Services
Planning Horizon: Proposed 2026?2029 strategic outlook

Executive Summary

The UCC-CES Partnership & Project Proposal Management System is a role-based web portal designed to support the Community Extension Services project lifecycle. It connects partner proposals and administrative review with event activation, volunteer participation, attendance, documentation, evaluations, and operational reporting.

The strategic priority is to turn the implemented capstone into a supportable institutional service: validate CES workflows, select UCC-approved production operations, assign business and technical owners, protect and test recovery of records, and prepare users for adoption. The current application is built with PHP 8.2 and MySQL; the repository documents local XAMPP setup, not an approved production environment.

Strategic Outcomes & Value Proposition for UCC-CES

- Connect proposals, partner collaboration, approvals, schedules, and events through a traceable workflow.
- Keep participation evidence together with attendance verification, event documentation, and evaluations.
- Support CES oversight with organized records and proposal, event, attendance, and evaluation reports.
- Plan for dependable use through approved hosting, protected backups, defined ownership, user training, and measured service performance.

System at a Glance

Users	Core lifecycle	Technology	Strategic result
CES Admin, partner/proponent, volunteer	Proposal ? review ? activation ? event ? records ? reports	PHP 8.2, MySQL, web portal	Traceability and decision support; outcomes to be measured

Suggested KPIs: proposal review time and completeness, attendance reconciliation, report time, active-user adoption, availability, and backup-restore success; establish baselines first.

Planning basis: Validate the prior CES process, production hosting, costs, operating ownership, and baseline performance; these are not confirmed findings.

Organization, Stakeholders & Strategic Alignment

Organization and stakeholders

UCC Community Extension Services coordinates community projects and participation with university units, partner organizations, proponents, volunteers, and community participants. CES administrators need review and oversight; proponents and partners need clear proposal and coordination workflows; volunteers need accessible event and participation information. CES process ownership and UCC ICT technical ownership are recommended planning roles and require confirmation.

Working problem statement

The deck identifies a working assumption that proposal, partner, event, attendance, and documentation information may be spread across forms, files, email, or spreadsheets. If confirmed, this may contribute to duplicate entry, follow-up effort, inconsistent status visibility, and difficult consolidation. Validate the baseline through CES interviews or process observation before describing these as measured problems.

Business strategy and IS alignment

CES business need	Information-system objective	Indicative measure
Coordinate community projects and partner participation	Standardize proposal briefs, partner records, and administrative review	Proposal completeness; review turnaround time
Turn approved projects into deliverable activities	Link approved proposals to event details and schedules	Proposal-to-event record completeness
Document service delivery and participation	Record applications, attendance, documentation, and evaluations	Attendance reconciliation; documentation completeness
Support planning and oversight	Provide filtered operational reports and exports	Report preparation time; report usage

Project-to-learning value chain

PROPOSE ? REVIEW ? ACTIVATE ? DELIVER ? DOCUMENT ? LEARN

Proposal submission requires a signed proposal letter and project brief; an MOA/MOU is optional. Proposal activation creates the linked event and scheduled dates.

Porter?s Five Forces ? public-service stakeholder environment

Force (public-service adaptation)	Strategic implication
Rivalry	Other community-service programs compete for partner attention and volunteer time.
New entrants	New initiatives may seek the same collaborators and resources.
Substitutes	Manual forms, email, spreadsheets, or other portals remain alternatives.
User / beneficiary power	Users expect accessible, clear participation and event information.
Supplier power	Hosting, internet, email, domain, and technical support affect continuity and cost.

Digital Strategy, Enterprise Architecture & Information Management

Current digital foundation and next priority

The capstone provides a multi-role portal for proposal management, partner coordination, events, attendance, documentation, evaluations, and reports. Current capabilities include date-locked QR attendance, PDF/CSV reports, and configurable SMTP. The next priority is operational readiness?not adding unvalidated AI, IoT, or blockchain features.

Architecture layer	UCC-CES alignment
Business	Proposal review, partnerships, volunteer participation, event delivery, attendance, reporting.
Data	Profiles, projects, partner links, event schedules, applications, attendance, documents, evaluations, and logs.
Application	Role-based portal and API, workflow modules, reports/exports, and QR attendance.
Technology	PHP 8.2, MySQL, Apache/local XAMPP; production hosting and recovery environment remain to be selected with UCC ICT.

Data lifecycle and control priorities

Lifecycle	System context and strategic requirement
Capture & use	Registration, proposal briefs, events, applications, attendance, and role-/partnership-scoped views.
Protect	Role checks, CSRF/session controls, password hashing, authenticated file delivery, selected activity logs, and attendance scan-integrity controls are implemented.
Retain & delete	Define CES-approved record ownership, privacy requirements, retention periods, correction, export, archival, and deletion rules.
Recover	Agree backup ownership, protection, recovery objectives, and successful restore tests. These operational arrangements are not established by the codebase.

IT governance, risk & operating model

Risk area	Current basis	Planned governance response
Unauthorized access and privacy exposure	Application-level role and session controls exist; deployment-wide assurance is not established.	UCC ICT/security review, least-privilege access, periodic access reviews, and incident procedures.
Loss, outage, or provider dependency	Local setup is documented; production service and recovery targets are undecided.	Approved hosting, protected backups, restore exercises, monitoring, and exit/portability terms.
Low adoption or inconsistent records	Institutional training and adoption baselines are not established.	Role-specific guides, user support, feedback, data-quality checks, and adoption measurement.

> Map proposed controls to cited COBIT, ITIL, or ISO 27001 references only after verifying the exact sources. Existing code controls do not establish certification or full-system compliance.

SWOT, Strategic Assessment & Gap Analysis

Strengths

Implemented multi-role workflows; linked proposal-to-event lifecycle; attendance, documentation, evaluations, and reporting.

Opportunities

More consistent records, evidence-based program planning, and future analytics once data quality and governance are ready.

Weaknesses

Production hosting, operational support ownership, training, and user adoption are not established in the project materials.

Threats

Data loss, downtime, privacy exposure, low adoption, and dependence on an external provider.

External PESTLE considerations

External factors	Planning consideration
Political / institutional + legal	UCC approval, policy alignment, ownership, privacy, retention, procurement, and contracts.
Economic + technological	Hosting, support, training, maintenance, connectivity, backups, compatibility, ICT capacity, and cost.
Social + environmental	Accessibility, digital literacy, adoption, and measured?not assumed?reduction in paper handling.

Current-to-target gaps

Area	Current basis	Target direction
Service & hosting	Capstone; local XAMPP setup documented.	Tested, documented service in a UCC-approved production environment.
Resilience	Production backup and restore arrangements not established.	Protected backups, named responsibility, and tested restoration.
Governance	Application controls are present.	Assigned owners, access review, retention, privacy, and incident procedures.
People & support	Training and help route not established.	Trained users, role-specific guidance, support, and feedback.

Acquisition analysis

Build/continue: strong workflow fit and reuse, but requires maintenance and handover. **Buy/customize:** license, workflow-fit, upgrade, and vendor risks. **Cloud/outsource:** managed expertise, but recurring costs, oversight, portability, and exit terms.

> **Recommended direction:** Retain the custom application as the workflow foundation; arrange UCC-approved hosting and support after ICT/security review, subject to policy, budget, security, and procurement approval.

Acquisition Requirements & Implementation Roadmap

Proposed TOR / RFP scope

Service scope	Minimum requirement
Production hosting and deployment	UCC-approved environment; preserve existing workflows and document configuration and handover.
Database, backups, and continuity	Managed MySQL operations; protected backups; documented and evidenced restore tests.
Security, privacy, and operations	Security assessment; privacy and access controls; monitoring, incident handling, patching, and assigned owners.
Training and support	Role-specific training, user documentation, support route, maintenance, and service targets.
Portability and exit	Source/data ownership, export capability, protected backups, documentation, and transition provisions.

Suggested evaluation weights

Criterion	Weight	Criterion	Weight
Technical / functional fit	30%	Security / privacy	25%
Support / continuity	20%	Total cost	15%
Portability / exit	10%	Suggested weights; UCC procurement approval required.	

Acceptance evidence

- Role and access-control tests pass.
- Proposal submission, review, activation, and linked event creation work end to end.
- QR check-in/check-out, attendance verification, and report exports are demonstrated.
- Backup restoration succeeds and is documented.
- Support ownership, service targets, data export, and exit terms are agreed.

Proposed six-month implementation roadmap

Phase	Indicative timing	Outcome
Validate	Month 1	Confirm workflows, baseline, owners, privacy, and requirements.
Design	Months 2?3	Approve architecture, security/recovery, and TOR/RFP.
Procure	Month 4	Select UCC-approved operations and support.
Pilot	Month 5	Deploy; test workflows/restoration; train pilot users.
Roll out	Month 6	Controlled launch, user support, and review.
